

Macintosh 16-inch Color Display COLOR ADJUSTMENTS PROCEDURE

Caution: This is an abbreviated version of other materials. Do not attempt this procedure unless you have first reviewed the CRT safety and discharge instructions located in Bulletins/Safety on Apple's Service Source CD, and have successfully performed at least one detailed video adjustment as described in the Macintosh 16-inch Color Display manual in Service Source.

Video/Color Adjustments (30 min. warmup)

Setup

1. Set the monitor in E/W direction and display the gray bars.
2. Set **Brightness** to detent and **Contrast** to max (CW).
3. Preset **Sub-Brightness** and **Sub-Contrast** to midrange.
4. Preset the **Red, Green, and Blue Drive** controls to midrange.
5. Preset the **Red and Blue Background** to minimum (CW).

Cutoff

6. Display the gray bars test pattern and adjust **Screen VR** (on main board) until the darkest bar is completely black and the next bar is barely visible.

White Balance

7. Turn up the **Blue Background** until the 6 darkest bars display a blue-green tint (CCW).
8. Turn up the **Red Background** until the 6 darkest bars display different shades of gray (CCW).
9. You may need to alternate between steps 7 and 8 until there is no predominant color in the 6 darkest bars.
10. Display the All-White screen pattern and measure the screen luminance. The measurement should be
 - 24 foot lamberts (\pm 3 ft lamberts)
 - Model L-248: 9 to 10 on the scale
 - Model 246: 19 on the red scale
11. Display the gray bars test pattern and check for these conditions:
 - Luminance is correct
 - No predominant color in any of the gray bars
 - The first (darkest) bar is black

If these 3 conditions are met, the white balance is set correctly. If these conditions are not met, follow the corrective steps in the chart.

Quick Reference

Note:

Rev A main board P/N: 661-1634
Rev B main board P/N: 661-1671
Video cable P/N: 590-0734

Display Condition:

- No predominant color
- Luminance too high
- First bar is not black
- No predominant color
- Luminance is too high
- First bar is black
- No predominant color
- Luminance is too low
- 6 brightest bars have a predominant color

Corrective Step:

- Adjust Sub-Brightness until the first bar is completely black.
- Adjust the Red, Green, and Blue Drive controls (ccw) to reduce screen luminance yet retain gray in the 6 brightest bars. The Red and Blue Backgrounds may need readjusting.
- Adjust the Red, Green, and Blue Drive controls (cw) to increase screen luminance yet retain gray in the 6 brightest bars. The Red and Blue Backgrounds may need readjusting.
- Adjust the Red, Green, and Blue Drive controls until there is no predominant color. The Red and Blue Backgrounds may need readjusting. Recheck screen luminance.
